

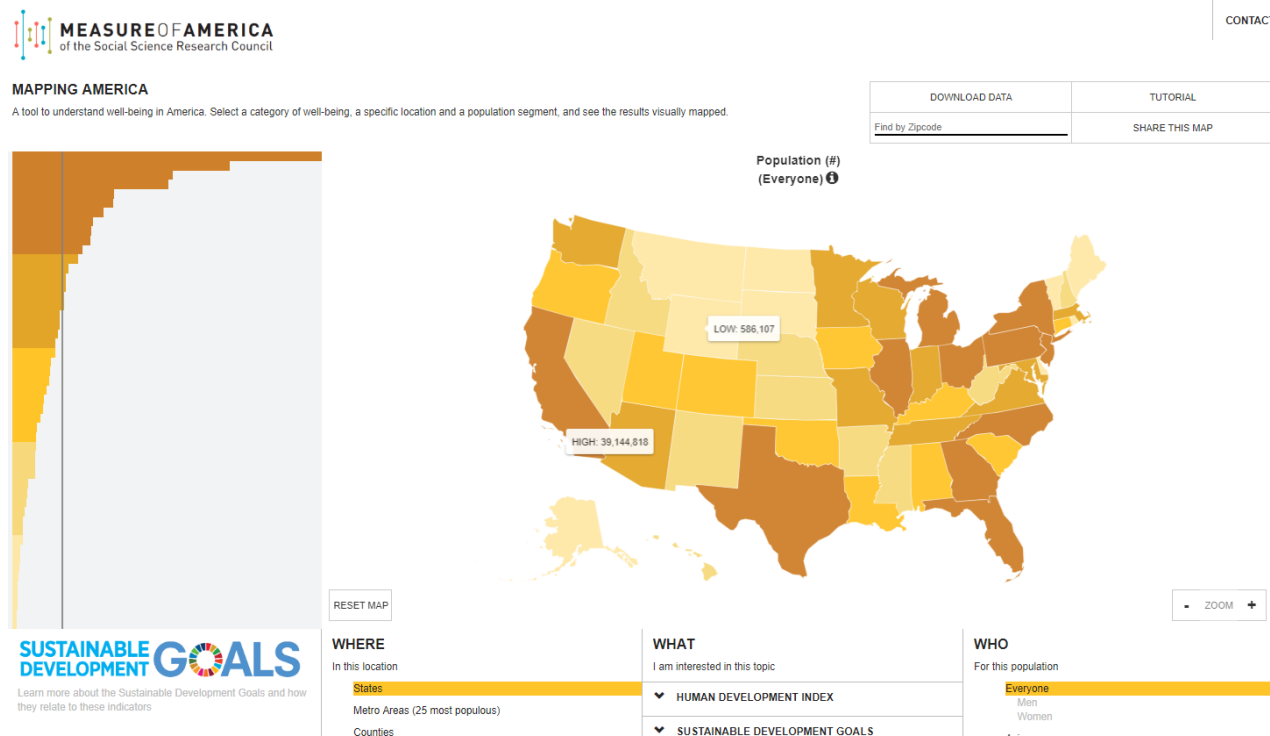

Mapping America – Tutorial Guide

Our Mapping America tool is a national mapping and data visualization tool that helps users understand well-being across America.

Start at measureofamerica.org/maps. The menu beneath the map shows categories of WHERE, WHAT and WHO. The map defaults to showing States, Population (#), and Everyone, i.e. the population by state. You can select a different type of geography (WHERE), a new subcategory of data (WHAT), or a new gender or race/ethnicity breakdown (WHO), or any possible combination.

Note that fewer data are available by gender or race/ethnicity, so that will limit other selections.

The visualization on the left side is a histogram showing the ranking of all geographies based on your data selections from the menu.

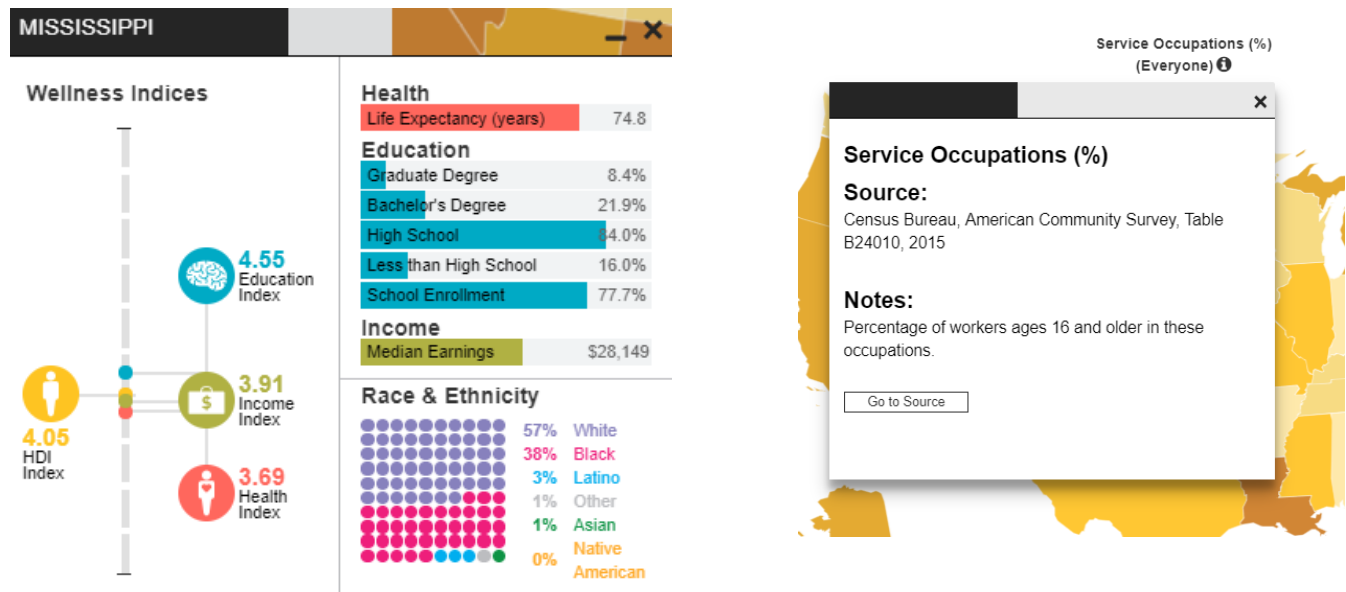

The geographies available in the tool are:

- States
- Metro areas (25 most populous)
- Counties
- Congressional districts

The data sectors available include:

- | | |
|--------------------------------------|------------------------|
| Human Development Index (HDI) | Health |
| Sustainable Development Goals (SDGs) | Housing |
| Demographics | Inclusion & Engagement |
| Education | Safety & Security |
| Environment | Work, Wealth & Poverty |

When you click on a geography on the map, a box appears on the left displaying a snapshot of that place, basic population demographics, as well as the Human Development Index, and Education, Health and Income indices if available.

The current indicator, as selected in the menu, is displayed at the top of the map. The info button will show the data source, year and any relevant notes for a given indicator.

You can always reset the map selections and return to the default view by clicking the RESET MAP button just above the menu. You can also download all or part of the dataset by clicking the DOWNLOAD DATA button, upper right area of the tool. There's also a SHARE button that creates a unique link for the indicator and geography you have selected.
